September 27, 2020

For System of $n \times n$ Linear Equations and if No of pivot columns = n , then

- ▶ Non Homogeneous system $Ax = b$ has unique solution.
- ▶ Columns of A will span \mathbb{R}^n .
- ▶ Homogeneous system $Ax = 0$ has only trivial solution.
- ▶ Columns of A will be linearly independent.

For System of $n \times n$ Linear Equations and if No of pivot columns $< n$ then

- ▶ Non Homogeneous system $Ax = b$ will not have solution for all $b \in \mathbb{R}^n$.
- ▶ Columns of A will not span \mathbb{R}^n .
- ▶ Homogeneous system $Ax = 0$ has non-trivial solution.
- ▶ Columns of A will be linearly dependent.

If System of Linear Equations is Under Determined (less equations in more variables) then

- ▶ Homogeneous system $Ax = 0$ has non trivial solution.
- ▶ Columns of A are linearly dependent.
- ▶ If Order of A is e.g 2×3 then columns of A will span \mathbb{R}^2 only if pivot columns $= 2$, i.e in this case the non homogeneous system $Ax = b$ will have either no solution or infinite solution.
- ▶ If Order of A is e.g 2×3 then columns of A will not span \mathbb{R}^2 only if pivot columns < 2 , i.e in this case the non homogeneous system $Ax = b$ will not have solution for $b \in \mathbb{R}^2$.

If System of Linear Equations is Over Determined (more equations in less variables) and if pivot columns = number of unknowns, then

- ▶ $Ax=0$ has only trivial solution.
- ▶ Columns of A are Linearly Independent
- ▶ If Order of A is e.g 3×2 then columns of A will not span \mathbb{R}^3 . i.e., in this case the non homogeneous system $Ax = b$ is not consistent for all $b \in \mathbb{R}^3$.

We will discuss here 4 applications of System of Linear Equations

- 1 A Homogeneous System in Economics (The system of 500 equations in 500 variables, known as a Leontief “input–output” (or “production”) model.)
There exist equilibrium prices that can be assigned to the total outputs of the various sectors in such a way that the income of each sector exactly balances its expenses.
- 2 Balancing Chemical Equations
- 3 Network Flow
- 4 Linear Equations and Electrical Networks

Input-Output Model

- Suppose that an economy is divided into sectors
- Each sector outputs goods and/or services which are then purchased by the other sectors
- There exist *equilibrium prices* that can be assigned to the total outputs of the various sectors in such a way that the income of each sector exactly balances its expenses

A Simplified Example

- Let's consider an economy that has three sectors: Coal, Electric, and Steel
- This table indicates how much of each sector's distribution is purchased by the other sectors:

Distribution of output from...

Coal	Electric	Steel	...purchased by
0%	40%	60%	Coal
60%	10%	20%	Electric
40%	50%	20%	Steel

Example (Cont.)

- Let p_C , p_E , and p_S be the total prices of the outputs of Coal, Electric, and Steel, respectively
- We are assuming that the income from each sector equals its expenses

Distribution of output from...

Coal	Electric	Steel	...purchased by
0%	40%	60%	Coal
60%	10%	20%	Electric
40%	50%	20%	Steel

This gives us three equations:

$$\begin{aligned}p_C &= 0.4p_E + 0.6p_S \\p_E &= 0.6p_C + 0.1p_E + 0.2p_S \\p_S &= 0.4p_C + 0.5p_E + 0.2p_S\end{aligned}$$

Example (Cont.)

Writing these equations in standard form, we have a homogeneous system:

$$\begin{aligned}p_C - 0.4p_E - 0.6p_S &= 0 \\ -0.6p_C + 0.9p_E - 0.2p_S &= 0 \\ -0.4p_S - 0.5p_E + 0.8p_S &= 0\end{aligned}$$

- Solving this system in the normal way gives us this solution set:

$$\begin{bmatrix} p_C \\ p_E \\ p_S \end{bmatrix} = p_S \begin{bmatrix} 0.94 \\ 0.85 \\ 1 \end{bmatrix}$$

- As usual, our homogeneous system has an infinite number of solutions
- If we knew additional information, say that $p_S = \$100$ million, then we could conclude $p_C = \$84$ million and $p_E = \$85$ million

Network Flow (Traffic Flow): Example

Network of one-way streets:

Problem: Find the flow rate of cars on each segment of streets. **Observation:**

- ▶ Flow into a junction (node/intersection) = flow out of that junction (node/intersection)
- ▶ Total Flow in = Total flow out

$$\boxed{\text{IN}} = \boxed{\text{OUT}}$$

total:

$$85 + x_4 = 120 + x_5$$

@ A:

$$85 = x_1 + x_2$$

@ B:

$$x_1 + x_3 + 45 = 120$$

@ C:

$$x_2 + x_4 = 70 + x_3$$

@ D:

$$70 = 45 + x_5$$

Example (Cont.)

$$\begin{cases} x_4 - x_5 = 35 \\ x_1 + x_2 = 85 \\ x_1 + x_3 = 75 \\ x_2 - x_3 + x_4 = 70 \\ x_5 = 25 \end{cases}$$

$$\begin{cases} x_1 = 75 - x_3 \\ x_2 = 10 + x_3 \\ x_3 = \text{free} \\ x_4 = 60 \\ x_5 = 25 \end{cases}$$

	x_1	x_2	x_3	x_4	x_5	
$\left[\begin{array}{ccccc c} 0 & 0 & 0 & 1 & -1 & 35 \\ 1 & 1 & 0 & 0 & 0 & 85 \\ 1 & 0 & 1 & 0 & 0 & 75 \\ 0 & 1 & -1 & 1 & 0 & 70 \\ 0 & 0 & 0 & 0 & 1 & 25 \end{array} \right]$						
$\left[\begin{array}{ccccc c} 1 & 0 & 1 & 0 & 0 & 75 \\ 0 & 1 & -1 & 0 & 0 & 10 \\ 0 & 0 & 0 & 1 & 0 & 60 \\ 0 & 0 & 0 & 0 & 1 & 25 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{array} \right]$						

Balancing Chemical Equations

Balance the following chemical equation (Burning Propane)

In its complete form this chemical equations says

Note.

- The numbers x_1, x_2, x_3, x_4 are positive integers.
- The number of atoms of each element on the left side is the same as the number of atoms of that element on the right side.

Note.

- The numbers x_1, x_2, x_3, x_4 are positive integers.
- The number of atoms of each element on the left side is the same as the number of atoms of that element on the right side.

$$\begin{cases} 3x_1 - x_3 = 0 \\ 8x_1 - 2x_4 = 0 \\ 2x_2 - 2x_3 - x_4 = 0 \end{cases} \quad \begin{cases} x_1 = \frac{1}{4}x_4 \\ x_2 = \frac{5}{4}x_4 \\ x_3 = \frac{3}{4}x_4 \\ x_4 = \text{free} \end{cases}$$

Linear Equations and Electrical Networks: Example

current =
flow rate of electrical charge

Current is measured in
amperes:

$$1\text{A} = \left(\begin{array}{l} \text{the electrical charge} \\ \text{of } 6.2 \cdot 10^{18} \text{ electrons} \\ \text{per second} \end{array} \right)$$

Goal.

Compute the currents I_1 , I_2 , I_3 .

Example (cont.)

@A:

$$I_1 + I_3 = I_2$$

Ohm's law:

$$\text{voltage drop} = I \cdot R$$

Kirchoff's second law:

In any loop:

$$(\text{v. gain}) - (\text{v. drop}) = 0$$

upper loop:

$$15 - 2I_1 - 4I_2 - 5I_1 = 0$$

lower loop:

$$20 - 4I_2 - 2I_3 = 0$$

Example (cont.)

$$\left[\begin{array}{ccc|c} 1 & -1 & 1 & 0 \\ 7 & 4 & 0 & 15 \\ 0 & 4 & 2 & 20 \end{array} \right]$$

row
reduction

$$\begin{array}{c} I_1 \quad I_2 \quad I_3 \\ \left[\begin{array}{ccc|c} 1 & 0 & 0 & 0.2 \\ 0 & 1 & 0 & 3.4 \\ 0 & 0 & 1 & 3.2 \end{array} \right] \end{array}$$

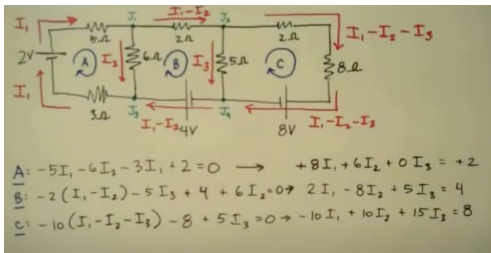

$$\begin{cases} I_1 = 0.2 \\ I_2 = 3.4 \\ I_3 = 3.2 \end{cases}$$

Example

Consider the following Electrical Flow. Determine the flow of current.

Label the flow as

Example (Cont.)

$$\begin{aligned}
 & \left[\begin{array}{ccc|c} 8 & 6 & 0 & 2 \\ 2 & -8 & 5 & 4 \\ -16 & 10 & 15 & 8 \end{array} \right] \\
 & 5R_2 + R_3 \rightarrow R_3 \\
 & \left[\begin{array}{ccc|c} 8 & 6 & 0 & 2 \\ 2 & -8 & 5 & 4 \\ 0 & -30 & 40 & 28 \end{array} \right] \\
 & R_1 - 4R_2 \rightarrow R_1 \\
 & \left[\begin{array}{ccc|c} 8 & 6 & 0 & 2 \\ 0 & 38 & -20 & -14 \\ 0 & -30 & 40 & 28 \end{array} \right] \\
 & \frac{1}{2}R_1 \rightarrow R_1 \\
 & \frac{1}{2}R_2 \rightarrow R_2 \\
 & \frac{1}{2}R_3 \rightarrow R_3 \\
 & \left[\begin{array}{ccc|c} 4 & 3 & 0 & 1 \\ 0 & 19 & -10 & -7 \\ 0 & -15 & 20 & 14 \end{array} \right] \\
 & R_2 + \frac{19}{15}R_3 \rightarrow R_2 \\
 & \left[\begin{array}{ccc|c} 4 & 3 & 0 & 1 \\ 0 & 19 & -10 & -7 \\ 0 & 0 & \frac{46}{3} & \frac{161}{5} \end{array} \right] \\
 & \frac{3}{46}R_3 \rightarrow R_3 \\
 & \left[\begin{array}{ccc|c} 4 & 3 & 0 & 1 \\ 0 & 19 & -10 & -7 \\ 0 & 0 & 1 & \frac{3}{10} \end{array} \right] \\
 & R_2 + 10R_3 \rightarrow R_2 \\
 & \left[\begin{array}{ccc|c} 4 & 3 & 0 & 1 \\ 0 & 19 & 0 & 0 \\ 0 & 0 & 1 & \frac{3}{10} \end{array} \right] \\
 & \frac{1}{19}R_2 \rightarrow R_2 \\
 & \left[\begin{array}{ccc|c} 4 & 3 & 0 & 1 \\ 0 & 1 & 0 & \frac{1}{19} \\ 0 & 0 & 1 & \frac{3}{10} \end{array} \right] \\
 & R_1 - 3R_2 \rightarrow R_1 \\
 & \left[\begin{array}{ccc|c} 4 & 0 & 0 & 1 \\ 0 & 1 & 0 & \frac{1}{19} \\ 0 & 0 & 1 & \frac{3}{10} \end{array} \right] \\
 & \frac{1}{4}R_1 \rightarrow R_1 \\
 & \left[\begin{array}{ccc|c} 1 & 0 & 0 & \frac{1}{4} \\ 0 & 1 & 0 & \frac{1}{19} \\ 0 & 0 & 1 & \frac{3}{10} \end{array} \right] \\
 & I_1 = 0.25A \\
 & I_2 = 0.0A \\
 & I_3 = 0.7A
 \end{aligned}$$
