

NAME: WIYAD HILWAN
Roll No: 191 1771
SECTION: BS-DS(N)
COURSE'S NAME: COMPUTER NETWORKS
DUE DATE: 13RD SEPTEMBER, 2022
ASSIGNMENT 1

Q1.

GIVEN:
Propagation Speed = $50 + [1771 \div 20]$
= 61 Km/hr

fa. CARAVAN DISTANCE TRAVELS = 175 Km

$$\begin{aligned}\text{PROPAGATION DELAY TIME} &= \frac{\text{TOTAL DISTANCE}}{\text{PROPAGATION SPEED}} \\ &= \frac{175}{61} = 2.869 \text{ hr} \\ &= 2 \text{ hour } 52 \text{ minutes } 8 \text{ Second}\end{aligned}$$

TIME FOR TAKEN BY TOTAL BOOTHING TO REACH 10 CARS = 2×3
= 6 minutes

$$\begin{aligned}\text{So end to end delay} &= 2 \text{ hour } 52 \text{ minutes } 8 \text{ Seconds} + \\ &\quad 6 \text{ minutes} \\ &= \boxed{2 \text{ hr } 58 \text{ minutes } 8 \text{ Seconds}}\end{aligned}$$

6. Time for taken by 3 toll booths to reach 8 cars
 $= (12 \text{ sec} \times 8) \times 3 = 288 \text{ secs} = 4 \text{ minutes } 48 \text{ seconds}$
 So end to end delay = 2 hour 52 minutes 8 seconds +
 4 minutes 48 seconds

$$= 2 \text{ hr } 56 \text{ minutes } 56 \text{ seconds}$$

Q2.

GIVEN:

$$\text{Packet Size} = 1200 + [1771 \bmod 25] \\ = 1221 \text{ bytes}$$

$$D_{\text{DELAY TIME } d(\text{proc})} = 0.003 \text{ Sec}$$

$$T_{\text{TRANSMIT PACKET}} = \frac{L}{R_i}$$

$$P_{\text{PROPAGATION } D_{\text{DELAY}}} = \frac{d_i}{S_i}$$

SOLUTION:

$$\frac{L}{R_1} = \frac{L}{R_2} = \frac{L}{R_3} = \frac{[1221 \times 8]}{2.5 \times 10^6} = \frac{9768}{2.5 \times 10^6} \\ = 3.9072 \times 10^{-3}$$

$$\frac{d_1}{S_1} = \frac{5000 \times 10^3}{2.5 \times 10^8} = 0.02$$

$$\frac{d_2}{S_2} = \frac{4000 \times 10^3}{2.5 \times 10^8} = 0.016$$

$$\frac{d_3}{S_3} = \frac{1000 \times 10^3}{2.5 \times 10^8} = 4 \times 10^{-3}$$

$$\begin{aligned}
 E_{\text{to}} E_{\text{D}} \text{ DELAY} &= 3[3.9072] + 0.02 \\
 &= 4 \times 10^{-3} + 0.016 + 2[0.003] \\
 &= 0.0117 + 0.04 + 0.006 \\
 &= \boxed{0.0577 \text{ Seconds}}
 \end{aligned}$$

Q3.

GIVEN:

$$\begin{aligned}
 L = \text{BYTES VALUE} &= 1100 + [1771 - 50] \\
 &= 1121
 \end{aligned}$$

$$\text{PACKET LENGTH} = 21$$

$$\text{TRANSMISSION RATE} = R = 2.5 \text{ Mbps}$$

$$\text{DATA TRANSMITTED BIT} = X = 1121$$

$$\text{WAITING QUEUE} = n = 4$$

$$\begin{aligned}
 \text{QUEUING DELAY} &= \frac{[n[2L] + [2L - X]]}{R} \\
 &= \frac{[4 \times [2 \times 1121] + [2 \times 1121 - 1121]]}{2.5 \text{ Mbps}}
 \end{aligned}$$

$$= \frac{8968 + 1121 \text{ bytes}}{2.5 \text{ Mbps}} = \frac{10089 \text{ bytes}}{2.5 \text{ Mbps}}$$

$$= \frac{10089 \times 8 \text{ bits}}{2.5 \times 10^6 \text{ bits per Seconds}}$$

$$= \boxed{0.0323 \text{ Seconds}}$$
